

Project

Comments to the implementation

The assumptions were as follows:

- create skeleton of project and then add components like footer and header,
- when spa was done, then next step was adding a form with redux and persistor.

Main assumption was to create some custom app with atlaskit components. Footer, Header and Mobile Menu was created as custom components without atlaskit.

I decide to use specific techniques because I like work like that. Some components are custom like footer, header and mobile menu without using for example Drawer. Validation is done in simple way in the same component as from. My favourite validation technique is using Formik and yup validator. I don't use it in this project.

Project was created as fastest as I can because I don't have so much time.
